

FREE STARTER PACK · HOLO · CLAUDE CODE + MEDIAPIPE

The Bare-Hands *Holo* Pack

Control your notes with your bare hands, through your webcam. Pinch cards out of the air and throw them with real momentum. Grab a real Smithsonian scan of the Apollo 11 capsule and pull it apart with two hands. Press one key and it all goes gold while an AI voice narrates what your hands do. No cloud, no API keys, no accounts — everything runs on your machine.

Run it in two minutes

What you need: Python 3 (already on every Mac; python.org for Windows) and Google Chrome. That is the whole list — the hand tracking ships inside the folder, so it works offline and ad-blockers cannot break it.

1. Unzip the folder anywhere
2. Open a terminal in that folder and run:

```
python3 server.py
```

3. Open Chrome at: `http://localhost:4890`
4. Allow the camera. Raise a hand.

1 Camera blocked?

Click the camera icon at the right end of Chrome's address bar, choose Allow, then hit RETRY CAMERA on the page. On a Mac, also check System Settings > Privacy & Security > Camera > Chrome.

2 Port already in use?

Run it on another port: `HOLO_PORT=4891 python3 server.py` — then open `localhost:4891`.

3 Page loads but acts strange after hours of uptime?

Stop the server (Ctrl+C) and run it again. Long-lived local servers on macOS can silently lose file access; a restart fixes it in five seconds.

4 Tracking feels off?

Light your hands. A lamp facing you beats any setting in the code — every webcam tracker on earth works better with bright, even light.

5 No camera handy?

Add `?sim=1` to the URL and a scripted pair of synthetic hands plays a demo loop. The mouse also works everywhere as a fallback.

Your hands are the interface

Best for: learning the full vocabulary in one sitting. An on-screen legend shows all of this while you play.

<i>Pinch a card</i>	Grab it. Drag it. Let go while moving and it flies with real momentum.
<i>Quick pinch (a tap)</i>	A folder orb fans out its files. A note opens in the reader. Tap the orb again to close the fan.
<i>Flick off-screen</i>	Throw a note hard enough to leave the screen and it evaporates. Reopen its orb to bring it back.
<i>Two-hand stretch</i>	Grab a note, pinch it with the other hand, pull apart — big opens it in the reader. Crush it small and the voice reads you the gist.
<i>Two pinches in empty space</i>	Zoom and rotate the whole scene.
<i>Open palm, snap to a fist</i>	Force-pull: the nearest far card flies into your hand on an amber beam.
<i>Palm thrust at the camera</i>	Repulsor blast. Everything near your palm shoves away.
<i>Point one finger</i>	Draw glowing ink in the air. It fades on its own.
<i>Sweep both palms down</i>	The whole board tidies itself into a clean grid.
<i>Peace sign, held</i>	The reset. Everything returns to its original place and size — a page refresh without the refresh.
<i>Drag to the right edge</i>	Dock a card on the shelf to keep it handy.

Make it yours: pinch means fingers actually touching — the deck deliberately ignores near-pinches so nothing fires by accident. If you remember one gesture, remember the held peace sign: it un-does any mess.

Museum pieces, in your hands

Best for: the moment you show a friend. Two real Smithsonian scans ship in the box — the Apollo 11 command module and a Triceratops skeleton, both public domain.

Grab a model and twist your wrist while pinching — it spins with inertia. Stretch it bigger with two hands and it **comes apart**: the closer you zoom, the more it separates into its pieces. Shrink it and it fuses back together. Single-mesh scans are automatically sliced into shards at load, so everything opens up, not just models that happen to have parts.

Any 3D model you can download becomes a prop. Drop a .glb file into the props folder and refresh:

```
holo-gestures-free/  
  props/  
    apollo-11-module.glb  
    triceratops.glb  
    your-model-here.glb      <- any .glb appears on the deck  
  
# If a downloaded model refuses to load it is usually Draco-compressed.  
# Decompress it once and it will work:  
npx @gltf-transform/cli copy in.glb out.glb
```

Make it yours: Sketchfab, the Smithsonian's 3d.si.edu, and Poly Pizza have thousands of free .glb downloads — skulls, engines, sneakers, planets. Check each model's license before using it in anything you sell.

Point it at your own brain

Best for: turning the demo into a tool. It ships with sample notes so it works instantly; one line points it at your real ones.

Edit **holo.json** in the folder and set the path to any folder of markdown files. Subfolders become orbs; files become the cards you pinch out of the air:

```
{"folder": "/path/to/your/notes"}
```

Then press **J** — Jarvis mode. The deck goes gold, and a voice speaks about what your hands do: file a card on the shelf and he says so; crush a note between your hands and he reads you the gist out loud. The voice is your computer's own local speech engine. No account, no key, no setup.

Privacy, in one sentence: the hand tracking runs entirely on this page, on your machine — camera frames never leave your computer, and the tracking libraries are shipped inside the folder rather than fetched from the internet.

Make it yours: the whole thing is one readable HTML file and one small Python server, MIT-licensed. Open holo.html and tune anything — gesture thresholds are named constants at the top of the script.

This deck is the free slice

HOLO is the hands. The full build is **JARVIS** — an AI second brain that runs on these same bare-hand controls, and then keeps going: a 3D galaxy of every note you own that you steer by hand, a voice you talk to that answers from your notes and flies the camera to its sources, real phone calls it makes on your behalf, email and calendar, a computer-takeover mode that drives your mouse while narrating — and eyes: it can see you, greet you when you sit down, and tell you to fix your posture with a straight face.

Every piece was built live with Claude Code, and the AI Workshop community gets the builds, the install lessons, and the method behind them — so you can build and sell your own.

Upgrade to the full Jarvis

The AI Workshop (paid community) has the complete JARVIS second brain, every install lesson, all the skill packs, and a community of builders shipping AI tools for real businesses.
